

As veins die

Endovenous laser treatment results in the natural answer, which is the transformation of the vein to scar tissue.

Vein

Thrombosed vein

Scar

In **deep vein thrombosis** the same process and result is seen.

Reasons for this transformation are:

- Irreparable damage by medical killing of the superficial vein.
- Chair-sitting over the years. This deprives our legs of their liveliness and eventually some deep veins therein of their right to live.

Veins are to die, if not needed.

The beginning of this process in deep veins is called DVT.

Understanding DVT is superior to knowledge about it.
